DELIVERABLES

We have prepared the last suite of deliverables and the PTR - the final report comprising all project results. The most interesting deliverables here are the ones publicly available (D6.3 & D6.6) as well as the handbooks that have been written to explain each service and ease its usage.

WHAT HAVE WE WORKED ON?

The consortium has finished its envisioned development of the proposed City Climate Services. An impressive suite of 13 services divided into two major service groups has been developed throughout the project's lifetime. We have developed City Administration Services that will support stakeholder decisions on a policy and administration level as well as Citizen Climate Services that aim to a) create awareness on the changing climate on a local level as well as b) offer adaptation tools that help protect citizens from climate change related adversities. The City Administration Service have been made available to interested stakeholders via a web application that serves as the frontend interface of the GCCP (the Generic City Climate Platform). The Citizen Climate Services are delivered via various different ways to either proprietary city websites via iFrame or web-widgets or are available on meteologix.com. These services are meant to be easy integratable and flexible, so that Cities can implement them with ease.
